Get more life from batteries with new 6-stage Projecta chargers

A new range of chargers that utilise the latest 6-stage technology for superior performance have been introduced by Projecta to breath life into a wide variety of vehicle and marine batteries.

Just released in New Zealand under the 'Pro-Charge' label, the new chargers can help restore drained and sulphated batteries and can be left connected to a battery indefinitely without the risk of overcharging. They are fully automatic, spark-free and polarity protected, which makes them safer for home use.

At the heart of Projecta 'Pro-Charge' is 6-stage charging technology, designed for use on a wide range of battery types, including automotive and marine as well as deep cycle batteries commonly found in boats, caravans and recreational vehicles.

Sophisticated electronic monitoring ensures a faster, comprehensive and professional charging style resulting in longer battery life and greatly enhanced performance compared with the traditional type of battery charger.

There are four 12-volt models in the 'Pro-Charge' range, including 4Amp; 8Amp; 16Amp and 21Amp. Each is designed to suit a range of battery sizes and each

PRESS RELEASE

features an adjustable output that can be set to as low as 2Amp to deliver optimum and safe charging.

For batteries that are older or used infrequently, the Pro-Charge has a rejuvenation mode that is used to restore tired batteries by breaking down sulphation and revitalising the battery cells. This mode is optional and runs for a full 24 hours and is ideally suited for periodic maintenance.

'Pro-Charge' battery chargers feature user-friendly controls and they remember the last settings even after the power has been turned off. For permanent installation in a boat or vehicle a mounting kit is provided.

The PC400 - 4 Amp model is ideally suited for charging smaller batteries typically found in motorcycles, jet skis, lawn mowers and small passenger vehicles, whilst the largest model PC2100 is a powerful charger for extra large batteries found in trucks, tractors, buses or regularly used deep cycle batteries but is also suitable for small-to-medium batteries.

The new Projecta 'Pro-Charge' Battery Chargers are available from leading automotive accessory outlets throughout New Zealand.

Each of the four models is presented in highly attractive, quality and innovative retail packaging to reflect the quality of the charger. There is a see-through window in the pack plus a visual application and vehicle guide on the top to assist the purchaser to see what they are buying and in the selection of the most appropriate model.
