

## NARVA®

### Latest European Mini-Bar emergency lamps released

 Printer friendly version here

The growing demand for low profile rotating and strobe emergency lighting in New Zealand has led to the release of the Euromax Mini-Bar range by NARVA.

The Mini-Bars are available in flange and magnetic base versions and all feature aerodynamically designed, virtually unbreakable, polycarbonate lenses in a low profile design for effective air flow so they create much less wind drag on vehicles at higher speeds and have little effect on stability or fuel consumption.

A broad reflector design in the rotating lamp models provides maximum light output and distribution while the strobe versions feature dual voltage circuitry and heavy duty flash tubes for increased resistance to sudden impact and vibration. All models feature two highly polished V-mirrors to multiply the flashes at the front and rear.

Marketed under the NARVA Euromax brand, the new bars are just 500mm long x 220 deep and only 110mm high, making them suitable for a wide range of applications from service utility and security vehicles to heavy equipment.

Flange base versions are available for permanent mounting and electrical connection. The magnetic base versions feature four large magnetic feet and cigarette lighter plug for more universal use within a fleet.

Euromax Mini-Bar emergency lamps are available in New Zealand from leading automotive parts suppliers and specialist safety lighting companies
